**GTL-1000** 

# GTL-1000

**Laser Scanner Total Station** 

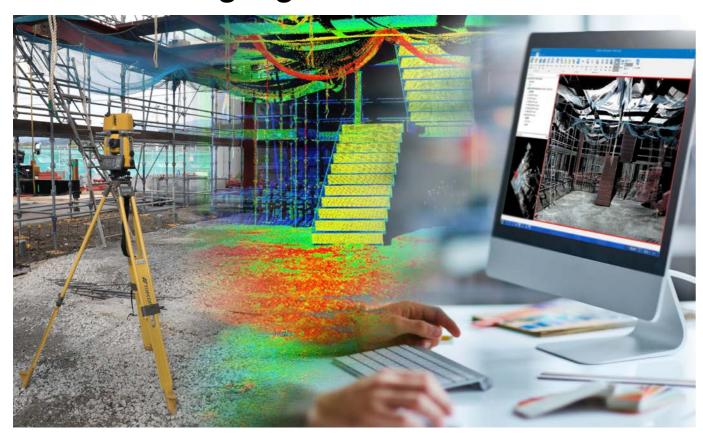

### **WORLD FIRST! Laser Scanner on Robotic Total Station**

- GTL-1000 performs accurate 3D scanning PLUS As-Built & Layout
- One single unit operation saves work time drastically
- Semi automatic hardware point cloud registration
- Best solution for BIM construction verification as well as Civil, Survey, and Maintenance application
- Onboard MAGNET Field software
- One man Survey and remote control by a field controller

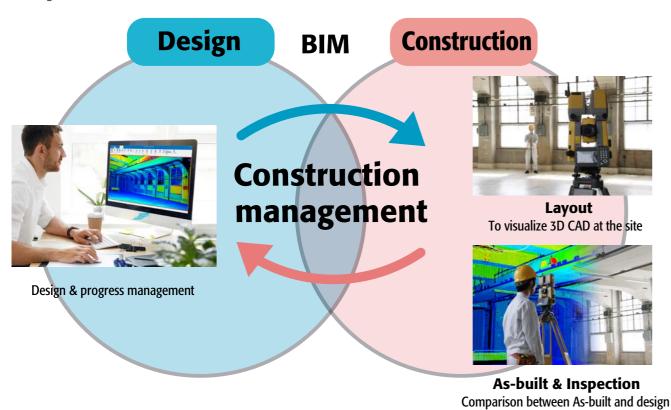

\*As a rotating type laser scanner built on Auto Tracking Robotic TS as of Sep 2019

# **Revolutionizing Digital Construction Workflows**

BIM (Building Information Modeling) has been getting more popular in construction industry, which enables the fast understanding of the site, or the time and cost management of the project. BIM has been driven by the design model as the front loading but 3D data has to come back and forth between

the office (Virtual) and the site (Real) for updating 3D model. However, the lack of this update sometimes becomes the bottle neck in the construction. Laser Scanner Total Station GTL-1000 can collect 3D data at the site quickly to solve this bottle neck issue.

# One single unit operation saves work time drastically!!

### **Efficient workflow**

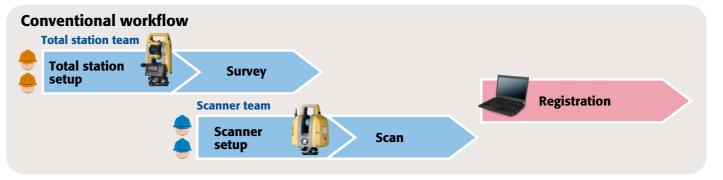

In a conventional way, it was required to use total station and laser scanner separately at the same site. Once we tried to work with total station and laser scanner simultaneously, we required more workers. If we tried to work with them and the same man power, we needed more time to complete the work.

# Drastic reduction of the investment cost, the working hours and the number of workers!

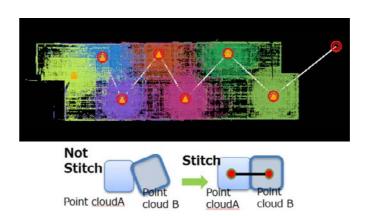

Robotic total station and full dome laser scanner got integrated into GTL-1000! In addition to the investment cost, GTL-1000 improves the workflows. It gives you more benefits.

New workflow with GTL-1000. It can perform both total station point measurement and scanning. So your team can be as small as possible and it enables you to do the field work in a fastest way. Point clouds registration time can be minimized because the point clouds are referred to the coordinate points where GTL-1000 measured.

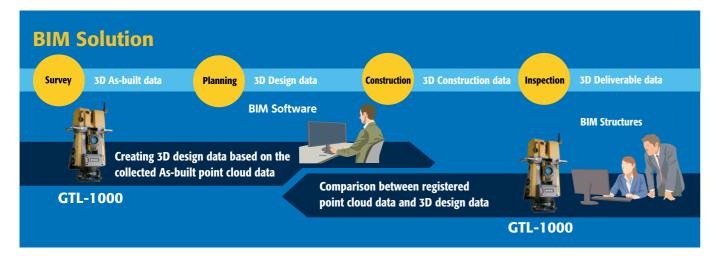

# Generation of scanned point cloud data based on the local coordinate system

While we are doing traverse survey with GTL-1000, we can use the same GTL-1000 for scanning. So we can register the point

clouds data accurately even for the multiple rooms and floors building, or the objects with no particular features. GTL-1000 gives the solution for the accurate point cloud registration for you to work faster, more accurately and safely.

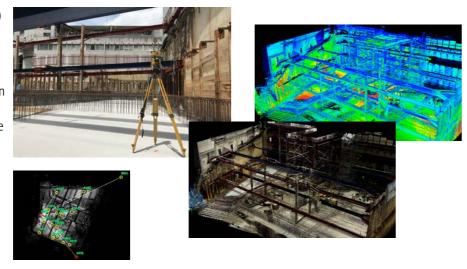

# **Applications for GTL-1000**

### **BIM application**

### **BIM (Building Information Modeling)**

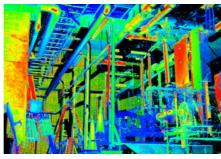

The divers BIM applications or GTL-1000 include scanning terrains, As-built checking for refurbishment of outdoor and indoor area. You can leverage 3D point clouds data for the design data creation. Once you complete the scanning at the site, you can utilize it for the maintenance and renovation afterwards.

# As-built checking for the facility structure

It is required for a pre-check and verification once you work on facility replacement, renovations. It is beneficial for the facility measurement if you are able to scan in a short time with accurate point cloud data. You can create 3D drawing based on point clouds, simulate the pipe installation, clash detection and so on.

### Layout

Using designed 3D model, CAD drawing data, you can mark on the centre line on the pillar, finishing surfaces of floors, walls, reference lines for the construction etc.

### **Civil application**

### i-Construction

i-Construction which is to promote the productivity improvements of the construction sites in Japan by Japanese Ministry of Land, Infrastructure and Transport. (MLIT) Laser scanner, UAV technologies have been leveraged for terrain survey, progress and deliverable management. You can remarkably save the construction time of earthworks, paving, slope shaping, structure installation works and inspection documents submission.

### **Cross section scan for Tunnels**

Scan tunnel cross sections and collect 3D surface and shape information. Therefore, it is painless to make a 3D drawing even the complicated tunnel shapes like curves, intersections. You can extract cross sections wherever you want. And it is effortless to understand the differences between the design data and the scanned past shapes.

### **Survey application**

# Works for Survey/Registered land & building investigator

Enabled by MAGNET Field and office software, GTL-1000 efficiently performs land survey application. You can leverage GTL-1000 for public survey works like control points establishments. Regarding terrain survey, not only the general survey works but also you can scan terrains to capture 3D point clouds.

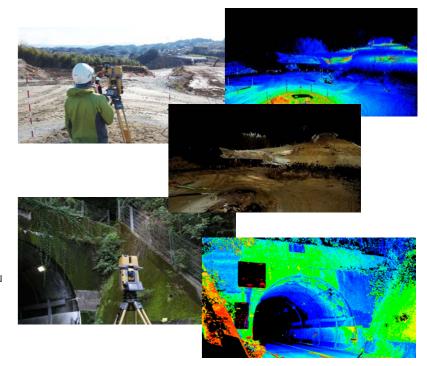

### **Maintenance application**

### Maintenance for infrastructure

Based on 3D point clouds which you scan the entire structure information, you can know the specific areas where you need to repair as a maintenance point of view, measurements of dimensions and shapes, calculating the costs which related to the repair etc. Plus, we do periodical measurement for aging deterioration check.

### Historical structures/ archaeological heritages

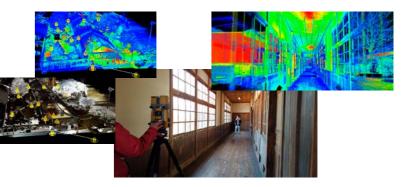

There is no design drawing for the most of historical, archaeological heritages structures. Once you use laser scanner which is allowing you not to touch/step on the structures, you are able to scan and collect detail point clouds without any damages on the structures. Your point clouds is colourised based on the real colour of the structures so that you can reproduce the feel of the structures. The collected point cloud data leverage the drawing for the maintenance as well as archives.

## Rotation type, High speed, high accurate scan

GTL-1000 can complete the full dome scan in about 1 minute. You can collect 3D point cloud data quickly. Surface accuracy is 5mm at 10 meter so that it fits the architectural construction.

### **Auto-tracking**

Layout with auto-tracking expands your workflow. One man operation with auto-tracking navigates you to the design point. Even for many design points, your job can be done quickly.

#### **Auto-collimating**

You don't need to focus the lens or collimating the target center manually. Auto-collimating provides consistent accuracy and speed regardless of operator's skill levels and condition.

### Data storage on SD card

Data storage is done on SD card. The points measured by total station and 3D point cloud data captured by scanner are both stored on SD card as the package file.

### Various types of measuring targets

For high precise measurement, it can use the prism as well as reflective target. Reflectorless mode is also available.

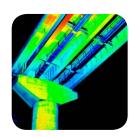

360 degree prism is useful for the control points to be measured from any scanning positions.

#### Laser pointer

It can emit the precise laser point by tapping the button. The rod man can move to the point with laser pointer.

#### **Full dome scan**

GTL-1000 has the rotating laser scanner to perform the full dome scanning quickly. Both inside and outside the buildings, GTL-1000 can work to collect 3D point cloud data to generate the shape of the object.

Main features

### One man survey

As robotic total station, one man survey can be done to measure each point.
Besides that, those area which cannot be scanned such as inside the bush, can be measured with total station.

### **Remote control scanning**

Using the data collector, you can control GTL-1000 remotely. Now GTL-1000 can be setup at any dangerous area such as the slope, over the cliff, and can be operated remotely from safe places.

### **Set Collection**

GTL-1000 can be purely used for Surveying. Set collection can be done automatically.

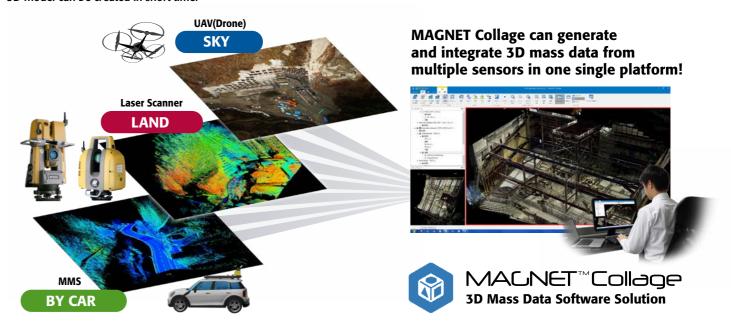

MAGNET Field is a powerful and intuitive field application software that enables you to collect survey mapping data and perform construction and road layout using total stations, levels, GNSS receivers and GTL-1000.

### **MAGNET Collage connects 3D solution to seamless site.**

MAGNET Collage is 3D Mass Data Software Solution to support processing, editing, exporting, and integrating point cloud data.

3D model can be created in short time.

### **Supporting various registration methods**

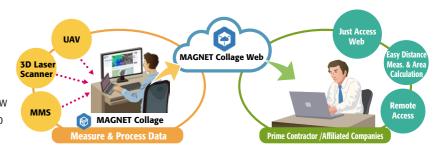

GTL-1000 can execute field work similar to that of total stations by supporting various registration methods.

|                       | Resection             | Reference Line        | Traverse            | Tie Point        | Shape Matching | Manual Registration | Station Set           |

### **3D Mass Data Viewer (Optional)**

MAGNET Collage Web is the web application to view point cloud mass data via the web browser. It can show slice view, measure a distance and calculate an area so you can check more detail information.

### Protect your total station.
